POWER DRENCHING AND TEAT SPRAY SYSTEMS

*Accuracy and
ease in the
cowshed...*

WHY RISK IT ALL...

Adding minerals to stock drinking water is expensive and affects water palatability. Cows drink less and produce less. Periods of wet weather when stock don't drink and are under stress can be a real disaster. Why risk it all?

DRENCHING IS BEST

Drenching minerals with a Numedic Drenching System is more cost effective and will maximise production. Cows will drink more and produce more. Cut out all the hassles. Drenching is best.

Metered Drench System

Accurate - This system consistently delivers a 120ml dose every time

Quick - The system is fast and delivers a "supercharged" shot to the cow.

Security - The Numedic metered drench system emits an audible sound so you know when the cow has been drenched.

No Frothing - Bloat oil has its own separate container. This ensures that the bloat oil will not froth or foam and will stay fresh and be effective.

Unmetered Drench System

Simple - Open the gun and count out your dose... one, two or three etc.

Cost Effective - Economically priced to suit any budget

Upgrade - The unmetered system can easily be upgraded to a metered drench system.

Teat Spray System

Simple - The 50 litre pressurized container provides a fine controllable mist at the nozzle.

Durable - Plastic non corrosive container, no "O" rings, seals or impeller to corrode and is ideal for iodine based teat sprays.

Affordable - The Numedic teat spray system is extremely cost effective.
